

ResponderVIEW

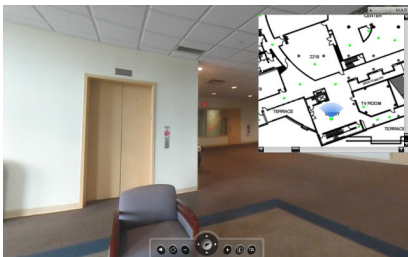

Virtual Emergency Workspace

ResponderVIEW is an intelligent workspace that enables effective capture, sharing and renewal of knowledge about facilities and infrastructure.

ResponderVIEW equips emergency response planners and first-responders with situational awareness in an emergency as well as training and support. The system guides emergency responders to critical areas in the facility such as locations of hazardous materials, water and gas shut-off, fire suppression equipment, electrical panels, HVAC, nearest egress, etc.

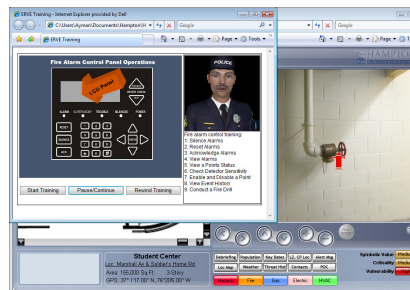

ResponderVIEW can be integrated with live camera feeds to provide real-time situational awareness in the context of the layout and characteristics of the facility.

ResponderVIEW provides renewable on-demand facility knowledge securely accessible using portable handheld devices via the Internet.

ResponderVIEW has the potential to dramatically improve how emergency responders and planners prepare for and respond to emergencies at critical and vulnerable facilities such

as schools, ports, military facilities, commercial centers, government buildings, etc.

ResponderVIEW provides high value and rapid return on investment. Some of its benefits include:

- **ResponderVIEW** is designed from the ground up to be affordable for local first responder agencies, local governments, school districts, etc.
- **ResponderVIEW** facilitates pre-planning sessions, communication, and collaboration between key security stakeholders and first responders.
- When a crisis occurs, the system provides instant secure access to complete data about the facility.
- Quicker access to information improves response times, reduces

human loss and property damage, and speeds recovery time.

- **ResponderVIEW** is fast and easy to use and is optimized to run efficiently on inexpensive mobile hardware and low bandwidth environments.
- An intuitive dashboard makes it cost effective to deploy to the various categories of users.
- The system is easy to update and maintain. Customers can self-manage and upload emergency response data that changes often without additional expense.
- **ResponderVIEW** is a highly scaleable enterprise system that can cost-effectively provide data on thousands of critical facilities and infrastructure.
- **ResponderVIEW** is a solution that replaces inefficient Emergency Binders, which are often out-of-date and difficult to use and access in an emergency when every minute counts, with a collaborative integrated system that effectively presents and fuses critical and real-time information in an efficient and easy to use interface.
